

FOR IMMEDIATE RELEASE:

The Building IT Company Conquers Conficker

Jacksonville, FL – April 2009 – The Conficker Worm has been notable in the media recently. While the payload was unknown, The Building IT Company took every precaution to make sure their clients were protected.

Microsoft released a patch to address this vulnerability back in October 2008. When the outbreak risk was initially announced in March for unpatched machines, The Building IT Company had already patched over 95% of the client-supported computers through their normal proactive patching processes. The Building IT Company has been working around the clock to ensure every last workstation was patched and additional safe guards were put into place to protect all of their clients' networks.

"We are happy to say that not one of our clients has reported any Conficker related issues so far and our systems have not detected any sign of infection on any of the networks we support. As always, we will continue to monitor their individual desktops, laptops and servers for any sign of problems." stated The Building IT Company CEO, Doug Lowenthal.

The Building IT Company prides itself on proactive customer service and is dedicated to taking care of the technology issues of small to medium-sized business. Many companies throughout Florida and nationally rely on the Managed Services provided by The Building IT Company to take care of their daily technology needs.
